# Chrome extension Test

Thanks for taking the time to attempt the test.

1. Create a GitHub repository
2. Create a new Chrome extension
3. When someone clicks on the chrome extension icon it should bring a login form with social login buttons
4. Only implement the login form which takes a name and the password "password"
5. Store the user details locally and if it is clicked on again show 'Hi {{name}}' and add a logout button which removes the local data
6. If a user is logged in, monitor their inactivity/dwell time on a page. If the time exceeds 5s with no action/input display a popup message on the page:

7. If the user clicks 'No' - it closes. If the user clicks 'Yes' it opens https://help.nickelled.com in a new tab and closes

Bonus points:

✓ Design/look and feel of the login and popup message
✓ Use of typescript
✓ Use of tailwind
✓ Using a webcomponent for the popup message
